TITLE: Method of obtaining liquid lubricant-coolant for rolling thin steel strips. Class 23, No. 173369		
SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 15, 1965, 68		
TOPIC TAGS: lubricant, coolant, liquid lubricant, rolling lubricant, cold rolling, strip rolling		
ABSTRACT: This Author Certificate introduces a method for the preparation of a liquid coolant-lubricant based on methylenebisamide of synthetic fatty acid used, for instance, in rolling thin transformer or stainless-steel strips. To obtain a stable lubricant which would make it possible to roll the strips to a required thickness, an alkylsulfonate, alkylarylsulfonate, or hydroxyethyl amine of fatty acid containing five Hydroxy radicals is added to the methylenebisamide of synthetic fatty acid. In a variant, the specified components are melted and then emulsified in water. [Ag]

AUTHOR: Mystakov, V. V.

TITLE: Theory of type II bursts of solar radio emission

SOURCE: Astronomicheskiy zhurnal, v. 42, no. 4, 1965, 740-748

TOPIC TAGS: solar flare, radio emission, shock wave, plasma, plasma frequency, magnetic field, electron density, kinetic theory

ABSTRACT: The phenomenon of type II bursts is explained by the radio emission theory from shock waves propagating in the solar corona. The following assumptions are made concerning the gyration frequency, burst speed, and shock velocity:

$$\omega_{\text{He}}/\omega_L \ll 1, \quad V_s \ll c, \quad v \ll (m_e/m_i)^{1/2}c,$$

The analysis is made in the framework of kinetic theory for electron-Langmuir wave propagation in a rarefied plasma. For a Maxwellian electron density distribution, the steady state plasma wave energy is calculated to be

$$E_p \propto -\frac{1}{8\pi} \frac{(2n)^{1/2}}{\sqrt{3}} \left(\frac{m_e}{2m_i}\right)^{1/2} \left(\frac{V_{\text{He}}}{V_0}\right)^{-1} N e T \ln \frac{2\pi}{\cos(0)}.$$

The radio emission intensity from the shock wave is estimated on the basis of the

TITLE: Concerning the theory of the nonstationary multiple Compton scattering of gamma photons

SOURCE: Atomnaya energiya, v. 16, no. 2, 1964, 149-150

TOPIC TAGS: multiple Compton scattering, small angle, photon, gamma photon, Compton scattering

ABSTRACT: This paper presents a simple solution of the problem of the nonstationary scattering of gamma photons for small angles. The approximation

$$\cos \theta = 1 - \frac{\theta^2}{2}$$

has been used. The transfer equation is given for the photon flux for a plane unidirectional source of monochromatic gamma photons. A more detailed analysis for a point source in a homogeneous medium

Temperature Measurement in the Rotation Furnace (Izmereniye temperatury vo vrashchayushcheyya pechi)

PERIODICAL:

Ogneupory, 1959, Nr 4, pp 165-167 (USSR)

ABSTRACT:

When the rotation furnaces of the Yamskiy Kombinat were taken into operation chromel-alumel thermocouples were mounted. The thermo-electromotive force was transmitted by trolley wires and brushes which proved to be unfit (Fig 1). Due to bad contact between trolley wire and brush the accuracy of temperature measurements was influenced and the wear and tear of the potentiometer increased. In the workshop KIP of the Kombinat brushes were designed and produced which operate satisfactorily (Fig 2). The total view of the installation is presented in figure 3 and then discussed. The copper terminals were replaced by steel terminals which decreased the wear and tear of the trolley wires. After installation of the new brushes the potentiometer EP-120 gr. PP was used and later the potentiometer EPP-09 gr. KhA Point Nr 2. The new brush is simple in handling and needs to be cleaned and lubricated only once a month. There are 4 figures.

ABSTRACT: A high resolution procedure is developed for the investigation of the spectra of frozen gases. Powerful pulsed sources of the continuous spectrum have been developed, of the Lyman discharge type, and also sources of intense line spectra, namely a condensed spark discharge or a gliding spark. A special cryostat was constructed for low-temperature measurement in a vacuum spectrograph. In the 2,000 -- 1200 Å region at 77 K, the spectra of thin films of methane and xenon, deposited on a

TITLE: Laying Flexible Cords (O shnurovoy provodke)

PERIODICAL: Energetik, 1958, Nr 8, pp 36 (USSR)

ABSTRACT: The author concludes that the practice of stringing unenclosed flexible cords on rollers in blocks of flats and factories should be forbidden. The action of paint, lime and vitriol on them causes deterioration of the insulation and the possibility that the cord, overheating, will set fire to the surrounding media. The author recommends the use of cable enclosed in light metal tubing.

The various components of the equipment shown are as follows: 1 and 2) part of the spherical hinge, 3) a flange for clamping a mirror or a plate, 4) set screw, 5) metallic washer for the set screw, 6) a soft gasket, 7) the gas laser tube, 8) a support. The instrument allows fast and accurate adjusting of the gas laser and can orient the electric field vector of the radiated light waves in any desired manner. The author thanks I. L. Fabelinskiy for his influence on this work. Orig. art. has: 2 figures.

amount of information supplied by this method proved to be much greater than that of previous methods (particularly A1). A defect of the method is the great time-consuming task of handling the experimental records. It is suggested that in the future the amplitudes of reflections at different signal frequencies be averaged by accumulation on the photographic prints. That is, allow all 60 exposures of the selected images to be made on a single frame. Orig. art. has: 1 table.

ABSTRACT: This is a report on the use of the A5 method (as proposed at the Ionosphere Conference at Nice, December 11-12, 1961) in measuring absorption of radio waves in the ionosphere. This technique involves vertical sounding with continuously varying frequency. Measurements were made at standard ionosphere-scanning stations with the vertical Sp-3 sonde. This instrument permits measurements in the frequency range from 0.5 to 20.0 megahertz with a sounding frequency of 30 hertz, duration of sounding pulse of 100 microseconds, and a power of 20 kv in the pulse. Amplitude-height-frequency characteristics were obtained. The

Construction and Absolute Calibration of a Magneto-Electric Acoustic Generator

the piston. A small mirror 5 is attached to the top of the aluminium rod. Particular attention was paid to effective sealing between the piston and the walls (see Fig 2). The natural frequency of the generator was 185 c/s but the receiver was used at 50 c/s. The construction used was found to produce a sinusoidal change of pressure in the vessel 4 when a sinusoidal current was passed through the coil. The piston displacement was found to be proportional to the current in the coil. This makes it possible, after suitable calibration, to find the pressure amplitude in the vessel from the value of the current in the coil. A short theory of the generator is given. Its calibration was carried out as follows. The piston displacement was measured very accurately by using the mirror 5 of Fig 1 as one of the mirrors of a Michelson interferometer (Fig 3). The piston displacement was varied by passing a known d.c. or a.c. current through the energizing coil 2. From the proportionality of the current and piston displacement the

TITLE: Construction and Absolute Calibration of a Magneto-Electric Acoustic Generator (Konstruktsiya i absolutnaya graduirovka magnito-elektricheskogo akusticheskogo izluchatelya)

PERIODICAL: Akusticheskiy Zhurnal, 1958, Vol IV, Nr 2, pp 137-142 (USSR)

ABSTRACT: The present paper describes a generator which works inside a closed space whose dimensions are small compared with the acoustic wavelength and the method of absolute calibration of this generator is given. Errors in this calibration do not exceed 1-2%. The generator is shown in Fig 1. Change of pressure in the vessel 4 filled with liquid is produced by a piston 1 which is rigidly connected with an induction coil 2 which is placed in the radial field of a permanent magnet 3. The vessel 4 has two plane-parallel windows 7. To observe motion of the piston and to measure its displacement, an aperture was made through the centre of the magnet. Through this aperture, without touching the magnet, an aluminium rod passes, the rod is rigidly fixed to

problems in the construction of airplanes, rockets, and helicopters are examined. The pneumatic and hydraulic aircraft systems as well as hydraulic servos are described. Considerable attention is paid to the problems of aeroelasticity, service life, and aerodynamic heating. The factual and numerical data and the schematic diagrams of aircraft are taken from non-Soviet sources. The authors thank K. A. Lyubshinsky for writing article 3 of Ch. 2 and N. M. Nitrofanov who participated in selection of material for some chapters. Special appreciation is expressed to A. M. Okulov for illustrating the book and to Doctors of Technical Sciences A. R. PURPOSE AND COVERAGE: The book is intended for aeronautical engineers concerned with aircraft design and manufacture. It may also be useful to students of technical schools of higher education. The principles of aircraft construction and strength are discussed. The principles of arrangement are examined, and design methods for strength and rigidity are given. External design loads are analyzed, and other

Fig. 1. Dependence of the free energy on the temperature for a number of reactions between  $\text{SiCl}_4$  and different elements.

The above reaction was studied in vacuum over the temperature interval of 1150 to 1300°C at an average working pressure of  $\text{SiCl}_4$  of 0.2–0.4 atm. A schematic of the experimental installation is presented, and the experimental results are presented graphically (see Fig. 2). It was found that the optimum conditions for the purification of silicon by the above method are: reaction temperature – 1280°C; rate of  $\text{SiCl}_4$  flow – 20 g/hour; duration of process – 3 hours.
